Perfect maintenance for Dad this Father's Day

Effective yet gentle milk system cleaning

JURA's fine foam technology allows you to enjoy speciality coffees such as latte macchiato, cappuccino, espresso macchiato and flat white in outstanding quality. To keep things that way, we developed the milk system cleaner. Together with the automatic cleaning programme, the JURA milk system cleaner effectively removes milk fats and proteins. This keeps the pipes clean and hygienic for consistently fine, light-as-air milk foam.

Effective cleaning – long-lasting protection

In combination with the integrated, electronically controlled cleaning programme, the 2-phase cleaning tablet reliably removes coffee fats between the brewing unit and the coffee spout. As well as cleaning it also seals all the pipes, delaying the deposition of coffee fat with lasting effectiveness. Everything happens at the touch of a button and without the user having to reach into the machine.

CLARIS removes the need for descaling

The right water is crucial to the taste of the coffee because coffee consists in fact of 98 % water. In addition to calcium, minerals and fluorides, the tap water in many areas contains traces of lead, copper, aluminium and chlorine. Positioned directly in the water tank, the CLARIS filter freshly filters the water every time coffee is prepared. It completely absorbs harmful substances while retaining important fluorides, which help the flavours to really develop. With the optimum water quality, every cup of coffee becomes a full-bodied taste experience. CLARIS eliminates the need to descale the machine.

Father's Day Offer
